

Tandem Innovations - X2 Quick Start Guide

Here are some guiding points on using the X2:

- The “infinity-spin” in combination with a triple flame lighter has shown to be the most reliant way to heat.
- If you use a single or double flame lighter, you may want to heat a little bit higher than normally.
- A light to medium pack is usually a good idea.
- You can mix tip generations of the same metal.
- Some caps take longer to click than others, try using ones with similar timing or stop heating at the clicks of the first cap.

But those are no strict rules, please feel free to experiment around and contact me, if you learn something useful.

The X2 gets and stays hot for a long time.

Please keep that in mind during and after use.

Only use with stems that offer a secure connection with the X2.

If you run into issues during assembly, like the o-rings slipping underneath each other, apply a small amount of lubricant, for example bees wax.

Maintenance Instructions:

- Please clean the X2 before first using it.
- Use the dishwasher or alcohol and cotton swabs to clean.
- Avoid chemical cleaning solutions.

I hope you like the X2 as much as I do and have a great time with it! Please let me know if you run into any issues or have questions!
